DISCUSSION: The Site Inspection Prioritization (SIP) report for this site prepared by the Alternate Remedial Contracting Strategy (ARCS) contractor was reviewed. This site is an active 500 acre tank farm which has been in operation since the 1920s. Separator sludge and leaded tank bottoms are temporarily stored in containers and shipped off-site for disposal. In the past, two separate areas were used for landfarming of the separator sludge (2 acres), and the leaded tank bottoms (0.25 acres). The disposal areas were covered with soil following termination of landfarming activities in the late 1970s. Ground water is used for drinking in the area. The potential for the site to affect ground water used for drinking is low because the public drinking water wells are relatively deep at 1000 to 3000 feet, and the soil in the area has a low permeability. There are no drinking water intakes located in the surface water within 15 miles downstream of the site. Native grass currently covers the two disposal areas. Access to the site is limited because the site is fenced and has 24-hour security. Based on the results of the SIP, this site would not qualify for inclusion on the National Priorities List of Superfund sites. A decision of No Further Remedial Action Planned under Superfund will be entered and this site will be returned to the LDEQ for any further action, if appropriate, under state regulations.
